

CS151 Complexity Theory

Lecture 5
April 13, 2021

Remainder of lecture

- nondeterminism applied to space
- reachability
- two surprises:
 - Savitch's Theorem
 - Immerman/Szelepcsényi Theorem

April 13, 2021

CS151 Lecture 5

Nondeterministic space

- **NSPACE(f(n))** = languages decidable by a multi-tape NTM that touches at most f(n) squares of its work tapes *along any computation path*, where n is the input length, and $f : \mathbf{N} \rightarrow \mathbf{N}$

April 13, 2021

CS151 Lecture 5

Nondeterministic space

- Robust nondeterministic space classes:

$$\mathbf{NL} = \mathbf{NSPACE}(\log n)$$

$$\mathbf{NPSPACE} = \bigcup_k \mathbf{NSPACE}(n^k)$$

April 13, 2021

CS151 Lecture 5

Reachability

- Recall: at most n^k configurations of given NTM M running in **NSPACE(log n)**.
 - easy to determine if C yields C' in one step
 - configuration graph for M on input x:

April 13, 2021

CS151 Lecture 5

Reachability

- Conclude: **NL ⊆ P**
 - and **NPSPACE ⊆ EXP**
 - **S-T-Connectivity (STCONN)**: given directed graph $G = (V, E)$ and nodes s, t, is there a path from s to t?
- Theorem:** STCONN is **NL**-complete under logspace reductions.

April 13, 2021

CS151 Lecture 5

Reachability

- Proof:
 - in **NL**: guess path from s to t one node at a time
 - given $L \in \mathbf{NL}$ decided by NTM M construct configuration graph for M on input x (can be done in logspace)
 - s = starting configuration; $t = q_{\text{accept}}$

April 13, 2021

CS151 Lecture 5

Two startling theorems

- Strongly believe **$P \neq NP$**
- nondeterminism seems to add enormous power
- for space: Savitch '70:
 $NPSPACE = PSPACE$
and
 $NL \subseteq SPACE(\log^2 n)$

April 13, 2021

CS151 Lecture 5

Two startling theorems

- Strongly believe **$NP \neq coNP$**
- seems impossible to convert existential into universal
- for space: Immerman/Szelepcsényi '87/'88:

$$\mathbf{NL} = \mathbf{coNL}$$

April 13, 2021

CS151 Lecture 5

Savitch's Theorem

Theorem: $STCONN \subseteq \mathbf{SPACE}(\log^2 n)$

- Corollary: **$NL \subseteq \mathbf{SPACE}(\log^2 n)$**
- Corollary: **$NPSPACE = PSPACE$**

April 13, 2021

CS151 Lecture 5

Proof of Theorem

- input: $G = (V, E)$, two nodes s and t
- recursive algorithm:

```
/* return true iff path from x to y of length at most 2^i */
PATH(x, y, i)
if i = 0 return ( x = y or (x, y) ∈ E )      /* base case */
for z in V
  if PATH(x, z, i-1) and PATH(z, y, i-1) return(true);
return(false);
end
```

April 13, 2021

CS151 Lecture 5

Proof of Theorem

- answer to $STCONN$: **$PATH(s, t, \log n)$**
- space used:
 - (depth of recursion) \times (size of "stack record")
- **depth = $\log n$**
- claim stack record: " (x, y, i) " sufficient
 - size $O(\log n)$
- when return from $PATH(a, b, i)$ can figure out what to do next from record (a, b, i) and previous record

April 13, 2021

CS151 Lecture 5

Nondeterministic space

- Robust nondeterministic space classes:

$$NL = NSPACE(\log n)$$

$$NPSPACE = \cup_k NSPACE(n^k)$$

April 13, 2021

CS151 Lecture 5

Second startling theorem

- Strongly believe $NP \neq coNP$
- seems impossible to convert existential into universal
- for space: Immerman/Szelepcényi '87/'88:

$$NL = coNL$$

April 13, 2021

CS151 Lecture 5

I-S Theorem

Theorem: ST-NON-CONN $\in NL$

- Proof: slightly tricky setup:
 - input: $G = (V, E)$, two nodes s, t

April 13, 2021

CS151 Lecture 5

I-S Theorem

- want *nondeterministic* procedure using only $O(\log n)$ space with behavior:

April 13, 2021

CS151 Lecture 5

I-S Theorem

- observation: given **count** of # nodes reachable from s , can solve problem
 - for each $v \in V$, *guess* if it is reachable
 - if yes, *guess* path from s to v
 - if guess doesn't lead to v , reject.
 - if $v = t$, reject.
 - else counter++
 - if counter = **count** accept

April 13, 2021

CS151 Lecture 5

I-S Theorem

- every computation path has sequence of guesses...
- only way computation path can lead to accept:
 - correctly guessed reachable/unreachable for each node v
 - correctly guessed path from s to v for each reachable node v
 - saw *all* reachable nodes
 - t not among reachable nodes

April 13, 2021

CS151 Lecture 5

I-S Theorem

- $R(i)$ = # nodes reachable from s in at most i steps
- $R(0) = 1$: node s
- we will compute $R(i+1)$ from $R(i)$ using $O(\log n)$ space and nondeterminism
- computation paths with "bad guesses" all lead to reject

April 13, 2021

CS151 Lecture 5

I-S Theorem

- Outline: in n phases, compute $R(1), R(2), R(3), \dots, R(n)$
- only $O(\log n)$ bits of storage between phases
- in end, lots of computation paths that lead to reject
- only computation paths that survive have computed correct value of $R(n)$
- apply observation.

April 13, 2021

CS151 Lecture 5

I-S Theorem

- computing $R(i+1)$ from $R(i)$:

$R(i) = R(2) = 6$

- Initialize $R(i+1) = 0$
- For each $v \in V$, *guess* if v reachable from s in at most $i+1$ steps

April 13, 2021

CS151 Lecture 5

I-S Theorem

- if "yes", *guess* path from s to v of at most $i+1$ steps. Increment $R(i+1)$
- if "no", visit $R(i)$ nodes reachable in at most i steps, check that none is v or adjacent to v
 - for $u \in V$ *guess* if reachable in $\leq i$ steps; *guess* path to u ; counter++
 - **KEY: if counter $\neq R(i)$, reject**
 - at this point: **can be sure v not reachable**

April 13, 2021

CS151 Lecture 5

I-S Theorem

- correctness of procedure:
- two types of errors we can make
- (1) might guess v is reachable in at most $i+1$ steps when it is not
 - won't be able to guess path from s to v of correct length, so we will reject.

"easy" type of error

April 13, 2021

CS151 Lecture 5

I-S Theorem

- (2) might guess v is **not** reachable in at most $i+1$ steps when it is
 - then must **not** see v or neighbor of v while visiting nodes reachable in i steps.
 - but forced to visit $R(i)$ distinct nodes
 - therefore must try to visit node v that is **not** reachable in $\leq i$ steps
 - won't be able to guess path from s to v of correct length, so we will reject.

"easy" type of error

April 13, 2021

CS151 Lecture 5

Summary

- nondeterministic space classes
NL and **NSPACE**
- ST-CONN **NL**-complete

April 13, 2021

CS151 Lecture 5

Summary

- Savitch: **NSPACE = PSPACE**
 - Proof: ST-CONN \in **SPACE**($\log^2 n$)
 - open question:
NL = L?
- Immerman/Szelepcsényi : **NL = coNL**
 - Proof: ST-NON-CONN \in **NL**

April 13, 2021

CS151 Lecture 5

Introduction

Power from an unexpected source?

- we know **P** \neq **EXP**, which implies no poly-time *algorithm* for Succinct CVAL
- poly-size Boolean *circuits* for Succinct CVAL ??

Does **NP** have **linear-size, log-depth** Boolean circuits ??

April 13, 2021

CS151 Lecture 5

Outline

- Boolean circuits and formulas
- uniformity and advice
- the **NC** hierarchy and parallel computation
- the quest for circuit lower bounds
- a lower bound for formulas

April 13, 2021

CS151 Lecture 5

Boolean circuits

- **circuit C**
 - directed acyclic graph
 - nodes: AND (\wedge); OR (\vee); NOT (\neg); variables x_i

- C computes function $f: \{0,1\}^n \rightarrow \{0,1\}$ in natural way
 - identify C with function **f** it computes

April 13, 2021

CS151 Lecture 5

Boolean circuits

- **size** = # gates
- **depth** = longest path from input to output
- **formula (or expression)**: graph is a tree
- every function $f: \{0,1\}^n \rightarrow \{0,1\}$ computable by a circuit of size at most **$O(n2^n)$**
 - **AND** of n literals for each x such that $f(x) = 1$
 - **OR** of up to 2^n such terms

April 13, 2021

CS151 Lecture 5

Circuit families

- circuit works for specific input length
- we're used to $f: \Sigma^* \rightarrow \{0, 1\}$
- circuit **family** : a circuit for each input length $C_1, C_2, C_3, \dots = \{C_n\}$
- " $\{C_n\}$ computes f " iff for all x
$$C_{|x|}(x) = f(x)$$
- " $\{C_n\}$ decides L ", where L is the language associated with f

April 13, 2021

CS151 Lecture 5

Connection to TMs

- given TM M running in time $t(n)$ decides language L
- can build circuit family $\{C_n\}$ that decides L
 - size of $C_n = O(t(n)^2)$
 - Proof: CVAL construction
- Conclude: $L \in \mathbf{P}$ implies family of polynomial-size circuits that decides L

April 13, 2021

CS151 Lecture 5

Connection to TMs

- other direction?
- A poly-size circuit family:
 - $C_n = (x_1 \vee \neg x_1)$ if M_n halts
 - $C_n = (x_1 \wedge \neg x_1)$ if M_n loops
- decides (unary version of) HALT!
- oops...

April 13, 2021

CS151 Lecture 5

Uniformity

- Strange aspect of circuit family:
 - can "encode" (potentially uncomputable) information in family specification
- solution: **uniformity** – require specification is simple to compute
Definition: circuit family $\{C_n\}$ is **logspace uniform** iff TM M outputs C_n on input 1^n and runs in $O(\log n)$ space

April 13, 2021

CS151 Lecture 5

Uniformity

Theorem: \mathbf{P} = languages decidable by logspace uniform, polynomial-size circuit families $\{C_n\}$.

- Proof:
 - already saw (\Rightarrow)
 - (\Leftarrow) on input x , generate $C_{|x|}$, evaluate it and accept iff output = 1

April 13, 2021

CS151 Lecture 5

TMs that take advice

- family $\{C_n\}$ without uniformity constraint is called "**non-uniform**"
- regard "non-uniformity" as a limited resource just like time, space, as follows:
 - add read-only "advice" tape to TM M
 - M "decides L with advice $A(n)$ " iff
$$M(x, A(|x|)) \text{ accepts} \Leftrightarrow x \in L$$
 - note: $A(n)$ depends only on $|x|$

April 13, 2021

CS151 Lecture 5

TMs that take advice

- Definition: $\mathbf{TIME}(t(n))/f(n)$ = the set of those languages L for which:
 - there exists $A(n)$ s.t. $|A(n)| \leq f(n)$
 - TM M decides L with advice $A(n)$ in time $t(n)$
- most important such class:

$$\mathbf{P/poly} = \cup_k \mathbf{TIME}(n^k)/n^k$$

April 13, 2021

CS151 Lecture 5

TMs that take advice

Theorem: $L \in \mathbf{P/poly}$ iff L decided by family of (non-uniform) polynomial size circuits.

- Proof:
 - (\Rightarrow) C_n from CVAL construction; hardware advice $A(n)$
 - (\Leftarrow) define $A(n)$ = description of C_n ; on input x , TM simulates $C_{|x|}(x)$

April 13, 2021

CS151 Lecture 5

Approach to P/NP

- Believe $\mathbf{NP} \neq \mathbf{P}$
 - equivalent: “ \mathbf{NP} does not have uniform, polynomial-size circuits”
- *Even believe $\mathbf{NP} \not\subseteq \mathbf{P/poly}$*
 - equivalent: “ \mathbf{NP} (or, e.g. \mathbf{SAT}) does not have polynomial-size circuits”
 - implies $\mathbf{P} \neq \mathbf{NP}$
 - many believe: best hope for $\mathbf{P} \neq \mathbf{NP}$

April 13, 2021

CS151 Lecture 5

Parallelism

- uniform circuits allow refinement of polynomial time:

April 13, 2021

CS151 Lecture 5

Parallelism

- the \mathbf{NC} (“Nick’s Class”) **Hierarchy** (of logspace uniform circuits):
 - $\mathbf{NC}_k = O(\log^k n)$ depth, $\text{poly}(n)$ size
 - $\mathbf{NC} = \cup_k \mathbf{NC}_k$
- captures “efficiently parallelizable problems”
- not realistic? overly generous
- OK for proving non-parallelizable

April 13, 2021

CS151 Lecture 5
