

CS21

Decidability and Tractability

Lecture 21

February 26, 2018

Outline

- The complexity class NP
- The complexity class $NP \cap coNP$
- The complexity class PSPACE
 - a PSPACE-complete problem
 - PSPACE and 2-player games

coNP

- Is NP closed under complement?

Can we transform
this machine:

into this machine?

coNP

- language L is in **coNP** iff its complement ($\text{co-}L$) is in NP
- it is believed that **NP** \neq **coNP**
- note: $P = \text{NP}$ implies $\text{NP} = \text{coNP}$
 - proving $\text{NP} \neq \text{coNP}$ would prove $P \neq \text{NP}$
 - another major open problem...

coNP

- canonical coNP-complete language:

UNSAT = $\{\varphi : \varphi \text{ is an unsatisfiable 3-CNF formula}\}$

– proof?

coNP

Disjunctive
Normal Form
= OR of ANDs

- another example

3-DNF-TAUTOLOGY = $\{\varphi : \varphi \text{ is a 3-DNF formula and for all } x, \varphi(x) = 1\}$

– proof?

- another example:

EQUIV-CIRCUIT = $\{(C_1, C_2) : C_1 \text{ and } C_2 \text{ are Boolean circuits and for all } x, C_1(x) = C_2(x)\}$

– proof?

Quantifier characterization of coNP

- recall that a language L is in NP if and only if it is expressible as:

$$L = \{x \mid \exists y, |y| \leq |x|^k, (x, y) \in R\}$$

where R is a language in P.

Theorem: language L is in **coNP** if and only if it is expressible as:

$$L = \{x \mid \forall y, |y| \leq |x|^k, (x, y) \in R\}$$

where R is a language in P.

Proof interpretation of coNP

- What is a proof?
- Good formalization comes from NP:
$$L = \{x \mid \exists y, |y| \leq |x|^k, (x, y) \in R\}, \text{ and } R \in P$$

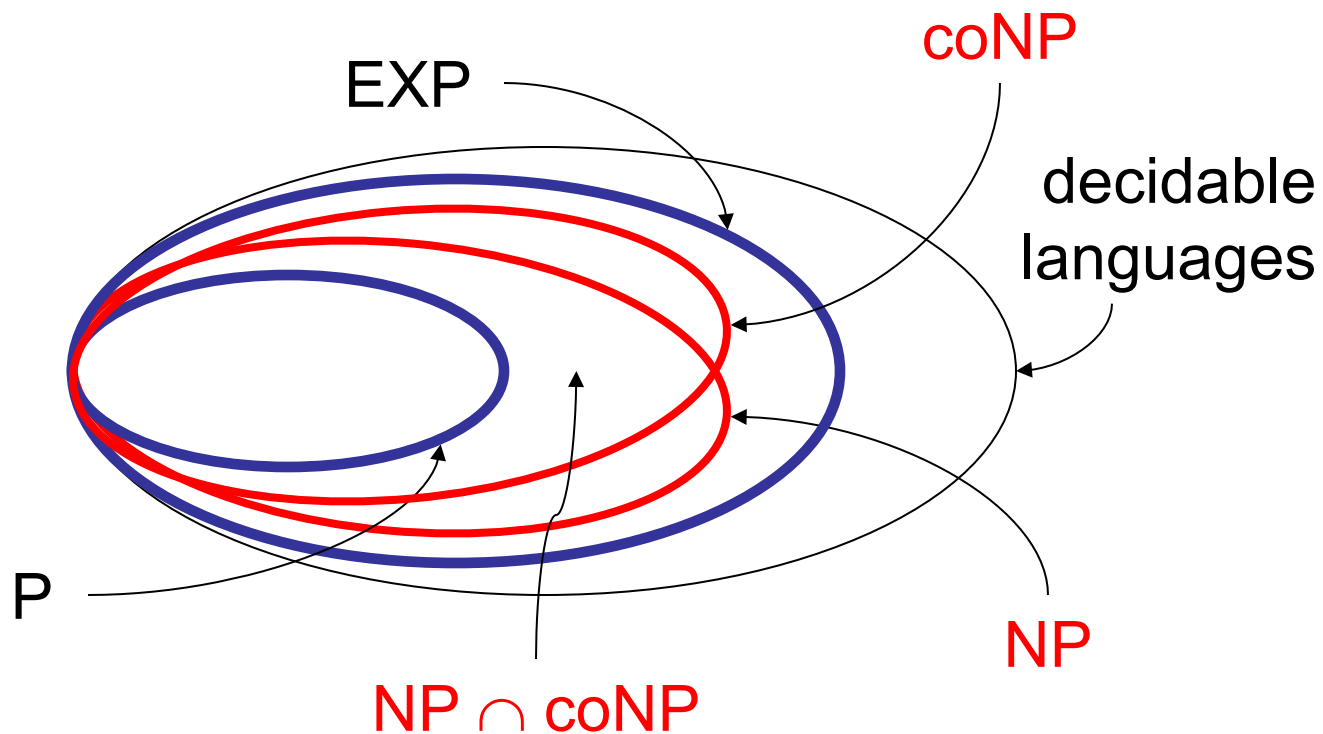

“proof” “short” proof “proof verifier”
- NP languages have short proofs of membership
- co-NP languages have short proofs of non-membership
- coNP-complete languages are least likely to have short proofs of membership

coNP

- what complexity class do the following languages belong in?
 - **COMPOSITES** = $\{x : \text{integer } x \text{ is a composite}\}$
 - **PRIMES** = $\{x : \text{integer } x \text{ is a prime number}\}$
 - **GRAPH-NONISOMORPHISM** = $\{(G, H) : G \text{ and } H \text{ are graphs that are not isomorphic}\}$
 - **EXPANSION** = $\{(G = (V, E), \alpha > 0) : \text{every subset } S \subset V \text{ of size at most } |V|/2 \text{ has at least } \alpha|S| \text{ neighbors}\}$

coNP

- Picture of the way we believe things are:

$NP \cap coNP$

- Might guess $NP \cap coNP = P$ by analogy with RE (since $RE \cap coRE = DECIDABLE$)
- Not believed to be true.
- A problem in $NP \cap coNP$ not believed to be in P:
 - $L = \{(x, k): \text{integer } x \text{ has a prime factor } p < k\}$
(decision version of factoring)

NP \cap coNP

- **Theorem**: This language is in NP \cap coNP:
 $L = \{(x, k): \text{integer } x \text{ has a prime factor } p < k\}$

Proof:

- In NP (why?)
- In coNP (what certificate demonstrates that x has *no* small prime factor?)
- Use this claim: PRIMES is in NP:
 $\text{PRIMES} = \{x : \forall 1 < y < x, y \text{ does not divide } x\}$

PRIMES in NP

Theorem: (Pratt 1975) PRIMES is in NP.

PRIMES = $\{x : \forall 1 < y < x, y \text{ does not divide } x\}$

• Proof outline:

– Step 1: give “ \exists ” **characterization** of PRIMES

– Step 2: this \implies **short certificate** of primality

– Step 3: certificate **checkable in poly time**

(we will skip, because...)

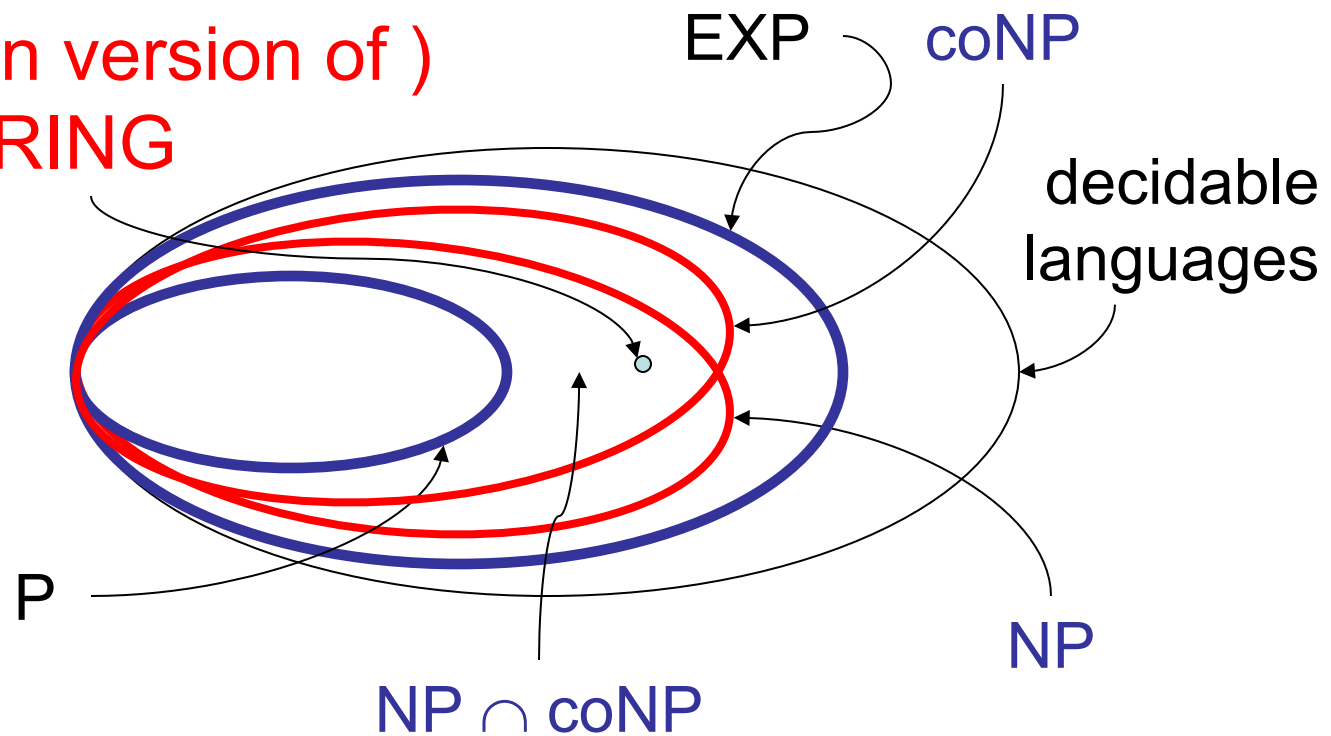

Theorem: (M. Agrawal, N. Kayal, N. Saxena 2002)

PRIMES is in P.

Summary

- Picture of the way we believe things are:

(decision version of)
FACTORING

Space complexity

Definition: the **space complexity** of a TM M is a function

$$f: \mathbf{N} \rightarrow \mathbf{N}$$

where $f(n)$ is the maximum number of tape cells M scans on any input of length n .

- “ M uses space $f(n)$,” “ M is a $f(n)$ space TM”

Space complexity

Definition: $SPACE(t(n)) = \{L : \text{there exists a TM } M \text{ that decides } L \text{ in space } O(t(n))\}$

$$PSPACE = \bigcup_{k \geq 1} SPACE(n^k)$$

PSPACE

- $NP \subset PSPACE$, $coNP \subset PSPACE$ (proof?)
- $PSPACE \subset EXP$ (proof?)
- containments believed to be proper
