January 15, 2025 CS21 Lecture 5 1

1

### Non-regular languages

**Pumping Lemma:** Let  $L$  be a regular language. **There exists** an integer  $p$  ("pumping length") for which **every**  $w \in L$  with  $|w| \geq p$  can be written as  $w = xyz$  such that

1. for every  $i \geq 0$ ,  $xy^iz \in L$ , and
2.  $|y| > 0$ , and
3.  $|xy| \leq p$ .

January 15, 2025 CS21 Lecture 5 2

2

### Non-regular languages

- Using the Pumping Lemma to prove  $L$  is not regular:
  - assume  $L$  is regular
  - then there exists a pumping length  $p$
  - select a string  $w \in L$  of length at least  $p$
  - argue that **for every** way of writing  $w = xyz$  that satisfies (2) and (3) of the Lemma, pumping on  $y$  yields a string not in  $L$ .
  - contradiction.

January 15, 2025 CS21 Lecture 5 3

3

### Proof of the Pumping Lemma

- Let  $M$  be a FA that recognizes  $L$ .
- Set  $p =$  number of states of  $M$ .
- Consider  $w \in L$  with  $|w| \geq p$ . On input  $w$ ,  $M$  must go through **at least**  $p+1$  states. **There must be a repeated state** (among first  $p+1$ ).

January 15, 2025 CS21 Lecture 5 4

4

### FA Summary

- A "problem" is a **language**
- A "computation" receives an input and either accepts, rejects, or loops forever.
- A "computation" **recognizes** a language (it may also **decide** the language).
- **Finite Automata** perform simple computations that read the input from left to right and employ a finite memory.

January 15, 2025 CS21 Lecture 5 5

5

### FA Summary

- The languages recognized by FA are the **regular languages**.
- The regular languages are **closed** under union, concatenation, and star.
- **Nondeterministic Finite Automata** may have several choices at each step.
- NFAs recognize **exactly the same** languages that FAs do.

January 15, 2025 CS21 Lecture 5 6

6

### FA Summary

- **Regular expressions** are languages built up from the operations union, concatenation, and star.
- Regular expressions describe **exactly the same** languages that FAs (and NFAs) recognize.
- Some languages are **not regular**. This can be proved using the **Pumping Lemma**.

11

### A more powerful machine

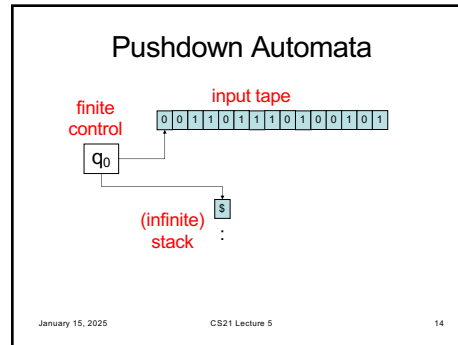

- limitation of FA related to fact that they can only “remember” a bounded amount of information
- What is the **simplest** alteration that adds unbounded “memory” to our machine?
- Should be able to recognize, e.g.,  $\{0^n 1^n : n \geq 0\}$

18

### Pushdown Automata (PDA)

- We will define **nondeterministic** pushdown automata immediately
  - potentially several choices of “next step”
- Deterministic PDA defined later
  - weaker than NPDA
- Two ways to describe NPDA
  - diagram
  - formal definition

January 15, 2025 CS21 Lecture 5 19

19

### NPDA diagram

tape alphabet  $\Sigma$  transition label: (tape symbol read, stack symbol popped  $\rightarrow$  stack symbol pushed)  
 stack alphabet  $\Gamma$

start state

states

accept states

transitions

January 15, 2025 CS21 Lecture 5 20

20

### NPDA operation

- Taking a transition labeled: **a, b  $\rightarrow$  c**
  - $a \in (\Sigma \cup \{\epsilon\})$
  - $b, c \in (\Gamma \cup \{\epsilon\})$
- read  $a$  from tape, or don't read from tape if  $a = \epsilon$
- pop  $b$  from stack, or don't pop from stack if  $b = \epsilon$
- push  $c$  onto stack, or don't push onto stack if  $c = \epsilon$

January 15, 2025 CS21 Lecture 5 21

21

### Example NPDA

$\Sigma = \{0, 1\}$   
 $\Gamma = \{0, 1, \$\}$

• tape: 0 0 1 1      Stack contents: \$

January 15, 2025 CS21 Lecture 5 22

22

### Example NPDA

$\Sigma = \{0, 1\}$   
 $\Gamma = \{0, 1, \$\}$

• tape: 0 0 1 1      Stack contents: 0 \$

32

33

### Formal definition of NPDA

• A NPDA is a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_0, F)$  where:

- $Q$  is a finite set called the **states**
- $\Sigma$  is a finite set called the **tape alphabet**
- $\Gamma$  is a finite set called the **stack alphabet**
- $\delta: Q \times (\Sigma \cup \{\epsilon\}) \times (\Gamma \cup \{\epsilon\}) \rightarrow \mathcal{P}(Q \times (\Gamma \cup \{\epsilon\}))$  is a function called the **transition function**
- $q_0$  is an element of  $Q$  called the **start state**
- $F$  is a subset of  $Q$  called the **accept states**

January 15, 2025      CS21 Lecture 5      34

34

### Formal definition of NPDA

• NPDA  $M = (Q, \Sigma, \Gamma, \delta, q_0, F)$  accepts string  $w \in \Sigma^*$  if  $w$  can be written as  $w_1 w_2 w_3 \dots w_m \in (\Sigma \cup \{\epsilon\})^*$ , and

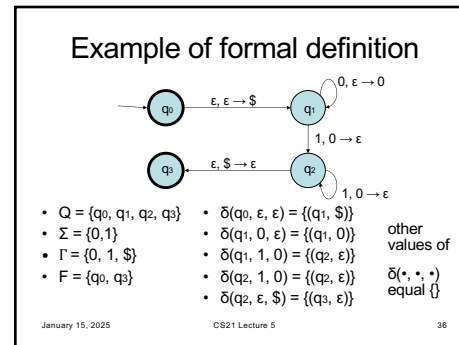

• there exist states  $r_0, r_1, r_2, \dots, r_m$ , and

• there exist strings  $s_0, s_1, \dots, s_m$  in  $(\Gamma \cup \{\epsilon\})^*$

- $r_0 = q_0$  and  $s_0 = \epsilon$
- $(r_{i+1}, b) \in \delta(r_i, w_{i+1}, a)$ , where  $s_i = at$ ,  $s_{i+1} = bt$  for some  $t \in \Gamma^*$
- $r_m \in F$

January 15, 2025      CS21 Lecture 5      35

35

36

### Exercise

Design a NPDA for the language

$\{a^i b^j c^k : i, j, k \geq 0 \text{ and } i = j \text{ or } i = k\}$

January 15, 2025 CS21 Lecture 5 37

37

### Context-free grammars and languages

- languages recognized by a (N)FA are exactly the languages described by **regular expressions**, and they are called the **regular languages**
- languages recognized by a NPDA are exactly the languages described by **context-free grammars**, and they are called the **context-free languages**

January 15, 2025 CS21 Lecture 5 38

38

### Context-Free Grammars

start symbol

$A \rightarrow 0A1$

$A \rightarrow B$

$B \rightarrow \#$

production

terminal symbols

non-terminal symbols

January 15, 2025 CS21 Lecture 5 39

39

### Context-Free Grammars

- generate strings by repeated replacement of **non-terminals** with **string of terminals and non-terminals**
  - write down start symbol (non-terminal)
  - replace a non-terminal with the right-hand-side of a rule that has that non-terminal as its left-hand-side.
  - repeat above until no more non-terminals

January 15, 2025 CS21 Lecture 5 40

40

### Context-Free Grammars

Example:

$A \Rightarrow 0A1 \Rightarrow 00A11 \Rightarrow 000A111 \Rightarrow 000\#111$

$A \rightarrow 0A1$

$A \rightarrow B$

$B \rightarrow \#$

- a **derivation** of the string 000#111
- set of all strings generated in this way is the **language of the grammar**  $L(G)$
- called a **Context-Free Language**

January 15, 2025 CS21 Lecture 5 41

41

### Context-Free Grammars

- Natural languages (e.g. English)
 

shorthand for multiple rules with same lhs

```

<sentence> → <noun-phrase><verb-phrase>
<noun-phrase> → <cpn-noun> / <cpn-noun><prep-phrase>
<verb-phrase> → <cpv-verb> / <cpv-verb><prep-phrase>
<prep-phrase> → <prep><cpn-noun>
<cpn-noun> → <article><noun>
<cpv-verb> → <verb> | <verb><noun-phrase>
<article> → a | the
<noun> → dog | cat | flower
<verb> → eats | sees
<prep> → with
      
```

Generate a string in the language of this grammar.

January 15, 2025 CS21 Lecture 5 42

42

## Context-Free Grammars

- CFGs don't capture natural languages completely
- computer languages often **defined** by CFG
  - hierarchical structure
  - slightly different notation often used "Backus-Naur form"
    - see next slide for example

January 15, 2025 CS21 Lecture 5 43

43

## Example CFG

```

<stmt> → <if-stmt> | <while-stmt> | <begin-stmt>
          | <asgn-stmt>
<if-stmt> → IF <bool-expr> THEN <stmt> ELSE <stmt>
<while-stmt> → WHILE <bool-expr> DO <stmt>
<begin-stmt> → BEGIN <stmt-list> END
<stmt-list> → <stmt> | <stmt>; <stmt-list>
<asgn-stmt> → <var> := <arith-expr>
<bool-expr> → <arith-expr> <compare-op> <arith-expr>
<compare-op> → < > | ≤ | ≥ | =
<arith-expr> → <var> | <const>
          | (<arith-expr> <arith-op> <arith-expr>)
<arith-op> → + | - | * | /
<const> → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9
<var> → a | b | c | ... | x | y | z
  
```

January 15, 2025 CS21 Lecture 5 44

44

## CFG formal definition

- A **context-free grammar** is a 4-tuple  $(V, \Sigma, R, S)$ 
  - where
    - $V$  is a finite set called the **non-terminals**
    - $\Sigma$  is a finite set (disjoint from  $V$ ) called the **terminals**
    - $R$  is a finite set of **productions** where each production is a non-terminal and a string of terminals and non-terminals.
    - $S \in V$  is the **start variable** (or start non-terminal)

January 15, 2025 CS21 Lecture 5 45

45

## CFG formal definition

- $u, v, w$  are strings of non-terminals and terminals, and  $A \rightarrow w$  is a production:
  - " $uAv$  yields  $uwv$ " notation:  $uAv \Rightarrow uwv$
  - also: "**yields in 1 step**" notation:  $uAv \Rightarrow^1 uwv$
- in general:
  - "**yields in  $k$  steps**" notation:  $u \Rightarrow^k v$
  - meaning: there exists strings  $u_1, u_2, \dots, u_{k-1}$  for which  $u \Rightarrow^1 u_1 \Rightarrow^1 u_2 \Rightarrow^1 \dots \Rightarrow^1 u_{k-1} \Rightarrow^1 v$

January 15, 2025 CS21 Lecture 5 46

46

## CFG formal definition

- notation:  $u \Rightarrow^* v$ 
  - meaning:  $\exists k \geq 0$  and strings  $u_1, \dots, u_{k-1}$  for which  $u \Rightarrow^1 u_1 \Rightarrow^1 u_2 \Rightarrow^1 \dots \Rightarrow^1 u_{k-1} \Rightarrow^1 v$
- if  $u =$  start symbol, this is a **derivation of  $v$**
- The **language of  $G$** , denoted  $L(G)$  is:
  - $\{w \in \Sigma^* : S \Rightarrow^* w\}$

January 15, 2025 CS21 Lecture 5 47
