

CS21
Decidability
and
Tractability

Lecture 6
January 18,
2023

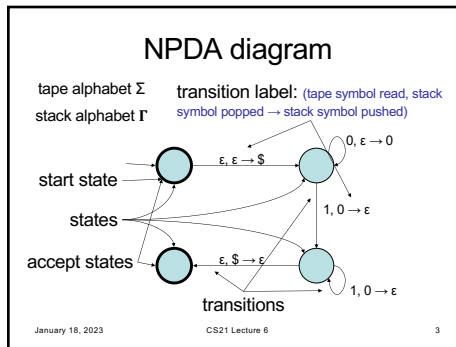

1

Outline

- Pushdown Automata
- Context-Free Grammars and Languages
- equivalence of NPDA's and CFGs

January 18, 2023 CS21 Lecture 6 2

2

3

NPDA operation

- Taking a transition labeled: $a, b \rightarrow c$

- $a \in (\Sigma \cup \{\epsilon\})$
- $b, c \in (\Gamma \cup \{\epsilon\})$

- read a from tape, or don't read from tape if $a = \epsilon$
- pop b from stack, or don't pop from stack if $b = \epsilon$
- push c onto stack, or don't push onto stack if $c = \epsilon$

January 18, 2023 CS21 Lecture 6 4

4

Formal definition of NPDA

- A NPDA is a 6-tuple $(Q, \Sigma, \Gamma, \delta, q_0, F)$ where:
 - Q is a finite set called the **states**
 - Σ is a finite set called the **tape alphabet**
 - Γ is a finite set called the **stack alphabet**
 - $\delta: Q \times (\Sigma \cup \{\epsilon\}) \times (\Gamma \cup \{\epsilon\}) \rightarrow \mathcal{P}(Q \times (\Gamma \cup \{\epsilon\}))$ is a function called the **transition function**
 - q_0 is an element of Q called the **start state**
 - F is a subset of Q called the **accept states**

January 18, 2023 CS21 Lecture 6 5

5

Formal definition of NPDA

- NPDA $M = (Q, \Sigma, \Gamma, \delta, q_0, F)$ accepts string $w \in \Sigma^*$ if w can be written as $w_1 w_2 w_3 \dots w_m \in (\Sigma \cup \{\epsilon\})^*$, and
- there exist states $r_0, r_1, r_2, \dots, r_m$, and
- there exist strings s_0, s_1, \dots, s_m in $(\Gamma \cup \{\epsilon\})^*$
 - $r_0 = q_0$ and $s_0 = \epsilon$
 - $(r_{i+1}, b) \in \delta(r_i, w_{i+1}, a)$, where $s_i = at, s_{i+1} = bt$ for some $t \in \Gamma^*$
 - $r_m \in F$

January 18, 2023 CS21 Lecture 6 6

6

Example of formal definition

- $Q = \{q_0, q_1, q_2, q_3\}$
- $\Sigma = \{0, 1\}$
- $\Gamma = \{0, 1, \$\}$
- $F = \{q_3\}$
- $\delta(q_0, \epsilon, \epsilon) = \{(q_1, \$)\}$
- $\delta(q_1, 0, \epsilon) = \{(q_1, 0)\}$
- $\delta(q_1, 1, 0) = \{(q_2, \epsilon)\}$
- $\delta(q_2, 1, 0) = \{(q_2, \epsilon)\}$
- $\delta(q_2, \epsilon, \$) = \{(q_3, \epsilon)\}$

other values of $\delta(\cdot, \cdot, \cdot)$ equal $\{\}$

January 18, 2023 CS21 Lecture 6 7

7

Exercise

Design a NPDA for the language

$\{a^i b^j c^k : i, j, k \geq 0 \text{ and } i = j \text{ or } i = k\}$

January 18, 2023 CS21 Lecture 6 8

8

Context-free grammars and languages

- languages recognized by a (N)FA are exactly the languages described by **regular expressions**, and they are called the **regular languages**
- languages recognized by a NPDA are exactly the languages described by **context-free grammars**, and they are called the **context-free languages**

January 18, 2023 CS21 Lecture 6 9

9

Context-Free Grammars

January 18, 2023 CS21 Lecture 6 10

10

Context-Free Grammars

- generate strings by repeated replacement of **non-terminals** with **string of terminals and non-terminals**
 - write down start symbol (non-terminal)
 - replace a non-terminal with the right-hand-side of a rule that has that non-terminal as its left-hand-side.
 - repeat above until no more non-terminals

January 18, 2023 CS21 Lecture 6 11

11

Context-Free Grammars

Example:

$A \Rightarrow OA1 \Rightarrow 00A11 \Rightarrow 000A111 \Rightarrow 000B111 \Rightarrow 000\#111$

- a **derivation** of the string 000#111
- set of all strings generated in this way is the **language of the grammar** $L(G)$
- called a **Context-Free Language**

January 18, 2023 CS21 Lecture 6 12

12

Context-Free Grammars

- Natural languages (e.g. English) shorthand for multiple rules with same lhs

```

<sentence> → <noun-phrase><verb-phrase>
<noun-phrase> → <cpx-noun> / <cpx-noun><prep-phrase>
<verb-phrase> → <cpx-verb> | <cpx-verb><prep-phrase>
<prep-phrase> → <prep><cpx-noun>
<cpx-noun> → <article><noun>
<cpx-verb> → <verb> | <verb><noun-phrase>
<article> → a | the
<noun> → dog | cat | flower
<verb> → eats | sees
<prep> → with
  
```

Generate a string in the language of this grammar.

January 18, 2023 CS21 Lecture 6 13

13

Context-Free Grammars

- CFGs don't capture natural languages completely
- computer languages often **defined** by CFG
 - hierarchical structure
 - slightly different notation often used "Backus-Naur form"
 - see next slide for example

January 18, 2023 CS21 Lecture 6 14

14

Example CFG

```

<stmt> → <if-stmt> | <while-stmt> | <begin-stmt>
           | <asgn-stmt>
<if-stmt> → IF <bool-expr> THEN <stmt> ELSE <stmt>
<while-stmt> → WHILE <bool-expr> DO <stmt>
<begin-stmt> → BEGIN <stmt-list> END
<stmt-list> → <stmt> | <stmt>, <stmt-list>
<asgn-stmt> → <var> := <arith-expr>
<bool-expr> → <arith-expr><compare-op><arith-expr>
<compare-op> → <|> | <|≤| ≥ | =
<arith-expr> → <var> | <const>
           | (<arith-expr><arith-op><arith-expr>)
<arith-op> → + | - | * | /
<const> → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9
<var> → a | b | c | ... | x | y | z
  
```

January 18, 2023 CS21 Lecture 6 15

15

CFG formal definition

- A **context-free grammar** is a 4-tuple (V, Σ, R, S)

where

- V is a finite set called the **non-terminals**
- Σ is a finite set (disjoint from V) called the **terminals**
- R is a finite set of **productions** where each production is a non-terminal and a string of terminals and non-terminals.
- $S \in V$ is the **start variable** (or start non-terminal)

January 18, 2023 CS21 Lecture 6 16

16

CFG formal definition

- u, v, w are strings of non-terminals and terminals, and $A \rightarrow w$ is a production:
 - " uAv yields uwv " notation: $uAv \Rightarrow uwv$
 - also: "yields in 1 step" notation: $uAv \Rightarrow^1 uwv$
- in general:
 - "yields in k steps" notation: $u \Rightarrow^k v$
 - meaning: there exists strings u_1, u_2, \dots, u_{k-1} for which $u \Rightarrow^1 u_1 \Rightarrow^1 u_2 \Rightarrow^1 \dots \Rightarrow^1 u_{k-1} \Rightarrow^1 v$

January 18, 2023 CS21 Lecture 6 17

17

CFG formal definition

- notation: $u \Rightarrow^* v$
 - meaning: $\exists k \geq 0$ and strings u_1, \dots, u_{k-1} for which $u \Rightarrow^1 u_1 \Rightarrow^1 u_2 \Rightarrow^1 \dots \Rightarrow^1 u_{k-1} \Rightarrow^1 v$
- if $u =$ start symbol, this is a **derivation** of v
- The **language** of G , denoted $L(G)$ is:
 - $\{w \in \Sigma^* : S \Rightarrow^* w\}$

January 18, 2023 CS21 Lecture 6 18

18

CFG example

- Balanced parentheses:
 - ()
 - ((()((()())))
- a string w in $\Sigma^* = \{ (,) \}^*$ is balanced iff:
 - # "(" equals # ")"s, and
 - for any prefix of w , # "("s \geq # ")"s

Exercise: design a CFG for balanced parentheses.

January 18, 2023 CS21 Lecture 6 19

19

CFG example

$$S \rightarrow (S) \mid SS \mid \epsilon$$

- Proof that $w \in L(G)$ implies w is balanced
 - induction on length of derivation
 - base case: length 1: $S \Rightarrow \epsilon$
 - general case: length n
 - $S \Rightarrow (S) \Rightarrow^{n-1} (w') = w$
 - $S \Rightarrow SS \Rightarrow^{n-1} w'w'' = w$

January 18, 2023 CS21 Lecture 6 20

20

CFG example

$$S \rightarrow (S) \mid SS \mid \epsilon$$

- Proof that w is balanced implies $w \in L(G)$
 - induction on length of w
 - base case: length 0: $w = \epsilon$
 - general case: length n
 - consider shortest prefix in language
 - if whole string then $w = (w')$ and w' balanced
 - if proper prefix then $w = w'w''$ with w' and w'' balanced

January 18, 2023 CS21 Lecture 6 21
