

CS21
Decidability
and
Tractability

Lecture 9
January 27, 2025

1

Summary

- Nondeterministic Pushdown Automata (NPDA)
- Context-Free Grammars (CFGs) describe Context-Free Languages (CFLs)
 - terminals, non-terminals
 - productions
 - yields, derivations
 - parse trees

January 27, 2025 CS21 Lecture 9 2

2

Summary

- grouping determined by grammar
- Chomsky Normal Form (CNF)
- NDPAs and CFGs are equivalent
- CFL Pumping Lemma is used to show certain languages are not CFLs

January 27, 2025 CS21 Lecture 9 3

3

Summary

- deterministic PDAs recognize DCFLs
- DCFLs are closed under complement
- there is an efficient algorithm (based on dynamic programming) to determine if a string x is generated by a given grammar G

January 27, 2025 CS21 Lecture 9 4

4

So far...

- several models of computation
 - finite automata
 - pushdown automata
- fail to capture our intuitive notion of what is computable

regular languages

context free languages

all languages

January 27, 2025 CS21 Lecture 9 5

5

So far...

- We proved (using constructions of FA and NPDAs and the two pumping lemmas):

$\{w : w \in \{a,b\}^* \text{ has an even \# of b's}\}$ $\{a^n b^n : n \geq 0\}$

regular languages

context free languages

all languages

$\{a^n b^n c^n : n \geq 0\}$

January 27, 2025 CS21 Lecture 9 6

6

A more powerful machine

- limitation of NPDA related to fact that their memory is stack-based (last in, first out)
- What is the **simplest** alteration that adds general-purpose “memory” to our machine?
- Should be able to recognize, e.g., $\{a^n b^n c^n : n \geq 0\}$

January 27, 2025 CS21 Lecture 9 7

7

Turing Machines

- New capabilities:
 - infinite tape
 - can read OR write to tape
 - read/write head can move left and right

January 27, 2025 CS21 Lecture 9 8

8

Turing Machine

- Informal description:
 - input written on left-most squares of tape
 - rest of squares are blank
 - at each point, take a step determined by
 - current symbol being read
 - current state of finite control
 - a step consists of
 - writing new symbol
 - moving read/write head left or right
 - changing state

January 27, 2025 CS21 Lecture 9 9

9

Example Turing Machine

language $L = \{w\#w : w \in \{0,1\}^*\}$

January 27, 2025 CS21 Lecture 9 10

10

Turing Machine diagrams

start state

states (1 accept + 1 reject)

transition label: (tape symbol read → tape symbol written, direction moved)

- a → R means “read a, move right”
- a → L means “read a, move left”
- a → b, R means “read a, write b, move right”

“ ” means blank tape square

January 27, 2025 CS21 Lecture 9 11

11

Example TM diagram

January 27, 2025 CS21 Lecture 9 12

12

TM formal definition

- A TM is a 7-tuple $(Q, \Sigma, \Gamma, \delta, q_0, q_{\text{accept}}, q_{\text{reject}})$ where:
 - Q is a finite set called the **states**
 - Σ is a finite set called the **input alphabet**
 - Γ is a finite set called the **tape alphabet**
 - $\delta: Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R\}$ is a function called the **transition function**
 - q_0 is an element of Q called the **start state**
 - $q_{\text{accept}}, q_{\text{reject}}$ are the **accept** and **reject** states

January 27, 2025 CS21 Lecture 9 13

13

Example TM operation

0 1 | | start

0 1 | | start

0 1 | | start

0 1 | | start

0 1 | | †

0 0 | | †

1 0 | | accept

program for "binary successor"

q	σ	$\delta(q, \sigma)$
start	0	(start, 0, R)
start	1	(start, 1, R)
start	-	(t, - L)
start	#	(start, #, R)
t	0	(accept, 1, -)
t	1	(t, 0, L)
t	#	(accept, #, R)

January 27, 2025 CS21 Lecture 9 14

14

TM configurations

- At every step in a computation a **configuration** determined
 - the contents of the tape
 - the state
 - the location of the read/write head
- next step completely determined by current configuration
- shorthand: string uq_v with $u, v \in \Gamma^*$, $q \in Q$

meaning:

- tape contents: uv followed by blanks
- in state q
- reading first symbol of v

January 27, 2025 CS21 Lecture 9 15

15

TM configurations

- configuration C_1 **yields** configuration C_2 if TM can legally* move from C_1 to C_2 in 1 step
 - notation: $C_1 \Rightarrow C_2$
 - also: "yields in 1 step" notation: $C_1 \Rightarrow^1 C_2$
 - "yields in k steps" notation: $C_1 \Rightarrow^k C_2$
- if there exists configurations D_1, D_2, \dots, D_{k-1} for which $C_1 \Rightarrow D_1 \Rightarrow D_2 \Rightarrow \dots \Rightarrow D_{k-1} \Rightarrow C_2$
- also: "yields in some # of steps" ($C_1 \Rightarrow^* C_2$)

*Convention: TM halts upon entering $q_{\text{accept}}, q_{\text{reject}}$

January 27, 2025 CS21 Lecture 9 16

16

TM configurations

- Formal definition of "yields":

$u, v \in \Gamma^*$
 $a, b, c \in \Gamma$
 $q_i, q_j \in Q$

$uaq_bv \Rightarrow uq_acv$

if $\delta(q_i, b) = (q_j, c, L)$, and

$uaq_bv \Rightarrow uacq_jv$

if $\delta(q_i, b) = (q_j, c, R)$

$(q_i \neq q_{\text{accept}}, q_{\text{reject}})$
- two special cases:
 - left end: $q_bv \Rightarrow q_cv$ if $\delta(q_i, b) = (q_j, c, L)$
 - right end: uaq_b same as uaq_c

January 27, 2025 CS21 Lecture 9 17

17

TM acceptance

- start configuration: q_0w (w is input)
- accepting config.: any config. with state q_{accept}
- rejecting config.: any config. with state q_{reject}

TM M accepts input w if there exist configurations C_1, C_2, \dots, C_k

- C_1 is start configuration of M on input w
- $C_i \Rightarrow C_{i+1}$ for $i = 1, 2, 3, \dots, k-1$
- C_k is an accepting configuration

January 27, 2025 CS21 Lecture 9 18

18

Deciding and Recognizing

- TM M:
 - L(M) is the language it **recognizes**
 - if M rejects every $x \notin L(M)$ it **decides** L
 - set of languages recognized by some TM is called **Turing-recognizable** or **recursively enumerable (RE)**
 - set of languages decided by some TM is called **Turing-decidable** or **decidable** or **recursive**

January 27, 2025 CS21 Lecture 9 19

19

Deciding and Recognizing

- TM M:
 - L(M) is the language it **recognizes**
 - if M rejects every $x \notin L(M)$ it **decides** L
 - set of languages recognized by some TM is called **Turing-recognizable** or **recursively enumerable (RE)**
 - set of languages decided by some TM is called **Turing-decidable** or **decidable** or **recursive**

January 27, 2025 CS21 Lecture 9 20

20

Classes of languages

- We know: regular \subseteq CFL (proper containment)
- CFL \subseteq decidable
 - proof?
- decidable \subseteq RE \subseteq all languages
 - proof?

January 27, 2025 CS21 Lecture 9 21

21

Multitape TMs

- A useful variant: **k-tape TM**

January 27, 2025 CS21 Lecture 9 22

22

Multitape TMs

- Informal description of **k-tape TM**:
 - input written on left-most squares of **tape #1**
 - rest of squares are blank **on all tapes**
 - at each point, take a step determined by
 - current **k** symbols being read **on k tapes**
 - current state of finite control
 - a step consists of
 - writing **k** new symbols **on k tapes**
 - moving each of **k** read/write heads left or right
 - changing state

January 27, 2025 CS21 Lecture 9 23

23

Multitape TM formal definition

- A TM is a 7-tuple $(Q, \Sigma, \Gamma, \delta, q_0, q_{\text{accept}}, q_{\text{reject}})$ where:
 - everything is the same as a TM except the transition function:

$$\delta: Q \times \Gamma^k \rightarrow Q \times \Gamma^k \times \{L, R\}^k$$

$\delta(q, a_1, a_2, \dots, a_k) = (q_i, b_1, b_2, \dots, b_k, L, R, \dots, L) =$
 “in state q_i , reading a_1, a_2, \dots, a_k on k tapes, move to state q_i , write b_1, b_2, \dots, b_k on k tapes, move L, R on k tapes as specified.”

January 27, 2025 CS21 Lecture 9 24

24

Multitape TMs

Theorem: every k -tape TM has an equivalent single-tape TM.

Proof:

– Idea: simulate k -tape TM on a 1-tape TM.
